

I need software to manage purchasing processes with the following requirements:

1. It should connect to Google Drive or any other cloud storage system so that images received via WhatsApp are automatically saved.
2. It should process these images, which come from four different banks, and use OCR to extract the reference and amount, automatically summing the amounts after each receipt.
3. It should allow saving receipts by WhatsApp number and customer name to maintain a detailed record of customer information.
4. At the end of the day, account statements are reviewed and a final check is made; I want the system to perform this final check, allowing the upload of the account statement and searching for matches with the references of the receipts already uploaded from Google Drive or any other storage system connected to WhatsApp.

Currently, I am using AppSheet and Google Sheets for this process. Here is an example: (<https://www.youtube.com/watch?v=qGJxsYHKM7g&t=277s>).

Finally, the developer can use the best program available for this work.
